

## ABSTRACT OF THE DISCLOSURE

Embodiments of event message endpoints in a distributed computing environment  
5 are described. A set of event messages that may be generated by a service in the  
distributed computing environment may be described in a data representation language  
event message schema for the service. For each event message in the schema, the  
endpoint may subscribe as a consumer of the event. A service may send a message  
including a data representation language representation of the event to each event  
10 message endpoint subscribed to the event. The event message endpoint may extract the  
representation of the event from the message and distribute it to clients with registered  
interest in the event type. The event message endpoint may type check the event message  
and/or the representation of the event against the message schema. Event messages  
endpoints may also authenticate the sender of the message and verify the integrity of  
15 message.
